

Touching new heights of excellence!

**JAVA PROGRAMMING
LAB MANUAL
B.Tech IIYR IV SEM**

OBJECTIVES:

- To teach the students basics of JAVA programs and its execution.
- To teach the students the differences between C++ and Java programming.
- To make the students learn concepts like packages and interfaces.
- To make the students understand life cycle of the applets and its functionality.
- To make the students understand the usage util package.
- To teach the student, to develop java programs using interfaces.

Recommended System/Software Requirements:

- Intel based desktop PC with minimum of 2.6GHZ or faster processor with at least 256 MB RAM and 40GB free disk space.
- Operating system: Flavor of any WINDOWS.
- Software:j2sdk1.7.
- Linux and MySQL.
- Eclipse or Net beam.

INTRODUCTION TO OOP

Object-oriented programming (OOP) is a computer science term used to characterize a programming language that began development in the 1960's. The term 'object-oriented programming' was originally coined by Xerox PARC to designate a computer application that describes the methodology of using objects as the foundation for computation. By the 1980's, OOP rose to prominence as the programming language of choice, exemplified by the success of C++. Currently, OOPs such as Java, J2EE, C++, C=, Visual Basic.NET, Python and java Script are popular OOP programming languages that any career-oriented Software Engineer or developer should be familiar with.

OOP is widely accepted as being far more flexible than other computer programming languages. OOPs use three basic concepts as the fundamentals for the Abstraction, Polymorphism, Event Handling and Encapsulation are also significant concepts within object-oriented programming languages that are explained in online tutorial describing the functionality of each concept in detail.

The java platform is undoubtedly fast moving and comprehensive. Its many application programming interfaces (APIs) provide a wealth of functionality for all aspects of application and system-level programming. Real-world developers never use one or two APIs to solve a problem, but bring together key functionality spanning a number of APIs, Knowing which APIs you need,

which parts of which APIs you need, and how the APIs work together to create the best solution can be a daunting task.

1. GUIDELINES TO STUDENTS

1. Equipment in the lab for the use of student community. Students need to maintain a proper decorum in the computer lab. Students must use the equipment with care. Any damage is caused is punishable.
2. Students are instructed to come to lab in formal dresses only.
3. Students are supposed to occupy the systems allotted to them and are not supposed to talk or make noise in the lab.
4. Students are required to carry their observation book and lab records with completed exercises while entering the lab.
5. Lab records need to be submitted every week.
6. Students are not supposed to use pen drives in the lab.

2. LAB OBJECTIVE

- To introduce Java compiler and eclipse platform.
- To make the student learn an object oriented way of solving problems using java.
- To make the students to write programs using multithreading concepts and handle exceptions.
- To make the students to write programs that connects to a database and be able to perform various operations.
- To make the students to create the Graphical User Interface using Applets, AWT Components & Swing Components.

3. LAB OUTCOME

- Able to use Java compiler and eclipse platform to write and execute java program.
- Understand and Apply Object oriented features and Java concepts.
- Able to apply the concept of multithreading and implement exception handling.
- Able to access data from a Database with java program.
- Develop applications using Console I/O and File I/O, GUI applications

4. INTRODUCTION ABOUT LAB

There are 30 systems (HP) installed in this Lab. Their configurations are as follows:

Processor	: Pentium(R) Dual-Core CPU E5700 @ 3.00GHz
RAM	: 1 GB
Hard Disk	: 320 GB
Mouse	: Optical Mouse

5. List of experiments as per the university curriculum

S.No.	Name of the Program	Page No.
1	Week1 : Use eclipse or Netbean platform and acquaint with the various menus, create a test project, add a test class and run it see how you can use auto suggestions, auto fill. Try code formatter and code refactoring like renaming variables, methods and classes. Try debug step by step with a small program of about 10 to 15 lines which contains at least one if else condition and a for loop.	8-9
2	Week 2 : Write a Java program that works as a simple calculator. Use a grid layout to arrange buttons for the digits and for the +, -, *, % operations. Add a text field to display the result. Handle any possible exceptions like divide by zero.	10-13
3	Week 3 : a) Develop an applet that displays a simple message. b) Develop an Applet that receives an integer in one text field & compute its factorial value & returns it in another text filed when the button “Compute” is clicked	14-16
4.	Week 4 : Write a program that creates a user interface to perform integer divisions. The user enters two numbers in the text fields, Num1 and Num2. The division of Num1 and Num2 is displayed in the Result field when the Divide button is clicked. If Num1 or Num2 were not an integer, the program would throw a NumberFormatException. If Num2 were Zero, the program would throw an Arithmetic Exception Display the exception in a message dialog box	17-19
5	Week 5 : Write a java program that implements a multi-thread application that has three threads. First thread generates random integer every 1 second and if the value is even, second thread computes the square of the number and prints. If the value is odd, the third thread will print the value of cube of the number.	20-22
6	Week 6 : Write a java program that connects to a database using JDBC and does	23-29

	add, deletes, modify and retrieve operations	
7	<p>Week 7 :</p> <p>Write a java program that simulates a traffic light. The program lets the user select one of three lights: red, yellow, or green with radio buttons. On selecting a button, an appropriate message with “stop” or “ready” or “go” should appear above the buttons in a selected color. Initially there is no message shown.</p>	30-34
8	<p>Week 8 :</p> <p>Write a java program to create an abstract class named Shape that contains two integers and an empty method named printArea(). Provide three classes named Rectangle, Triangle and Circle such that each one of the classes extends the class Shape. Each one of the classes contain only the method printArea() that prints the area of the given shape.</p>	35-36
9	<p>Week 9 :</p> <p>Suppose that a table named Table.txt is stored in a text file. The first line in the file header and the remaining lines correspond to row in the table. The elements are separated by commas. Write a Java program to display the table using labels in grid layout.</p>	37-39
10	<p>Week 10 :</p> <p>Write a Java program that handles all mouse events and shows the event name at the center of the window when a mouse event is fired. (Use adapter classes).</p>	40-42
11	<p>Week 11 :</p> <p>Write a java program that loads names and phone numbers from a text file where the data is organized as one line per record and each field in a record are separated by a tab (\t).it takes a name or phone number as input and prints the corresponding other value from the hash table(hint: use hash tables)</p>	43-45
12	<p>Week 12 :</p> <p>Implement the above program with database instead of a text file.</p>	46-50
13	<p>Week 13 :</p> <p>Write a java program that takes tab separated data (one record per line) from a text file and inserts them into a database</p>	51-54
14	<p>Week 14 :</p> <p>Write a java program that prints the meta-data of a given table.</p>	55-57

6. List of Additional Experiments

1	Write a Java program that prints all real solutions to the quadratic equation $ax^2+bx+c = 0$. Read in a, b, c and use the quadratic formula. If the discriminate b^2-4ac is negative, display a message stating that there are no real solutions?	58-59
2	The Fibonacci sequence is defined by the following rule. The first 2 values in the sequence are 1, 1. Every subsequent value is the sum of the 2 values preceding it. Write a Java program that uses both recursive and non-recursive functions to print the n^{th} value of the Fibonacci sequence?	60-62
3	Write a Java program that prompts the user for an integer and then prints out all the prime numbers up to that Integer?	63
4	Write a Java program that checks whether a given string is a palindrome or not. Ex: MADAM is a palindrome?	64
5	Write a Java program for sorting a given list of names in ascending order?	65-66
6	Write a Java program to multiply two given matrices?	67-68
7	Write a Java program that reads a line of integers and then displays each integer and the sum of all integers. (use StringTokenizer class)?	69-70
8	Write a Java program that reads on file name from the user, then displays information about whether the file exists, whether the file is readable, whether the file is writable, the type of file and the length of the file in bytes?	71
9	Write a Java program that reads a file and displays the file on the screen, with a line number before each line?	72
10	Write a Java program that displays the number of characters, lines and words in a text?	73-74

Solutions:-

1.Use eclipse or Netbean platform and acquaint with the various menus, create a test project, add a test class and run it see how you can use auto suggestions, auto fill. Try code formatter and code refactoring like renaming variables, methods and classes. Try debug step by step with a small program of about 10 to 15 lines which contains at least one if else condition and a for loop.

Program:-

```
public class Prog1
{
    public static void main(String[] args)
    {
        System.out.println("\n Prog. is showing even no");
        for(int i=2;i<=20;i++)
        {
            if(i%2==0)
            {
                System.out.print("\n "+i);
            }
        }
    }
}
```

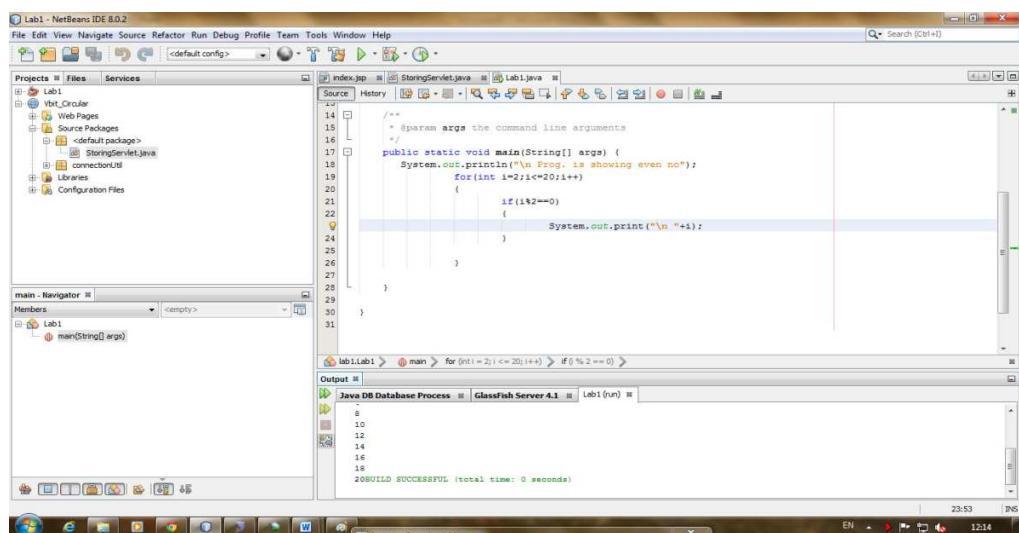

Compile:-

D:>javac Prog1.java

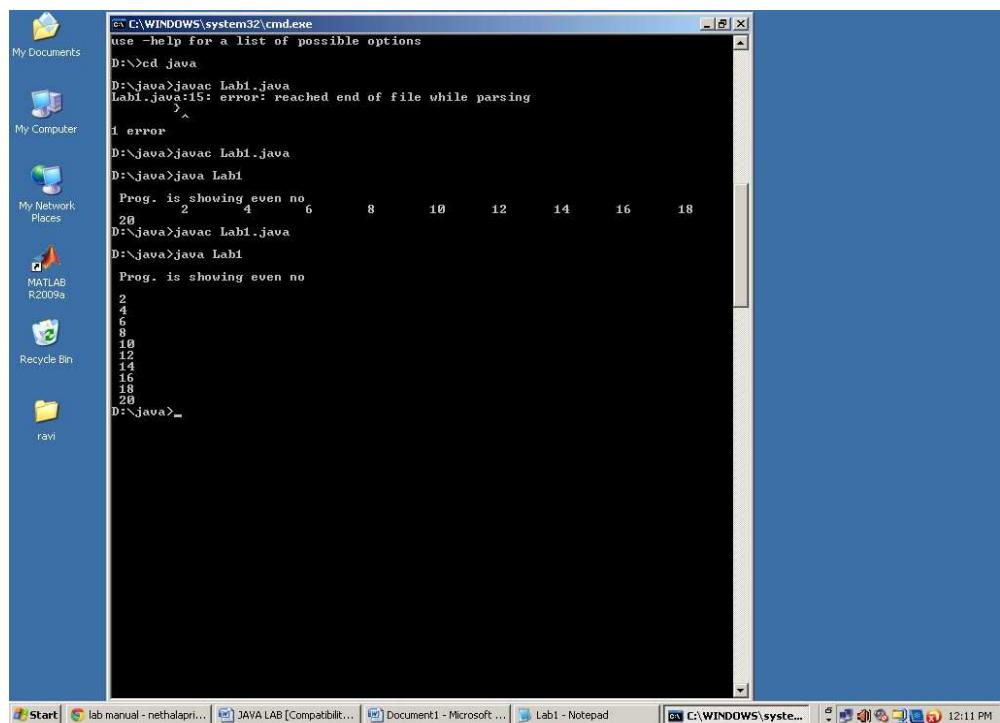

Run:-

D:>java Prog1

Output:-
In Netbeans IDE:-

In Command Prompt:-

2. Write a Java program that works as a simple calculator. Use a grid layout to arrange buttons for the digits and for the +, *, % operations. Add a text field to display the result. Handle any possible exceptions like divide by zero.

Program:-

```
import javax.swing.*;
import java.awt.*;
import java.awt.event.*;
//<applet code=Calculator height=300 width=200></applet>
public class Calculator extends JApplet
{
    public void init()
    {
        CalculatorPanel calc=new CalculatorPanel();
        getContentPane().add(calc);
    }
}
class CalculatorPanel extends JPanel implements ActionListener
{
    JButton n1,n2,n3,n4,n5,n6,n7,n8,n9,n0,plus,minus,mul,div,dot,equal;
    static JTextField result=new JTextField("0",45);
    static String lastCommand=null;
    JOptionPane p=new JOptionPane();
    double preRes=0,secVal=0,res;
    private static void assign(String no)
    {
        if((result.getText()).equals("0"))
            result.setText(no);
        else if(lastCommand=="=")
        {
            result.setText(no);
            lastCommand=null;
        }
        else
            result.setText(result.getText()+no);
    }
    public CalculatorPanel()
    {
        setLayout(new BorderLayout());
        result.setEditable(false);
        result.setSize(300,200);
        add(result,BorderLayout.NORTH);
        JPanel panel=new JPanel();
        panel.setLayout(new GridLayout(4,4));
```

```
n7=new JButton("7");
panel.add(n7);
n7.addActionListener(this);
n8=new JButton("8");
panel.add(n8);
n8.addActionListener(this);
n9=new JButton("9");
panel.add(n9);
n9.addActionListener(this);
div=new JButton("/");
panel.add(div);
div.addActionListener(this);
n4=new JButton("4");
panel.add(n4);
n4.addActionListener(this);
n5=new JButton("5");
panel.add(n5);
n5.addActionListener(this);
n6=new JButton("6");
panel.add(n6);
n6.addActionListener(this);
mul=new JButton("*");
panel.add(mul);
mul.addActionListener(this);
n1=new JButton("1");
panel.add(n1);
n1.addActionListener(this);
n2=new JButton("2");
panel.add(n2);
n2.addActionListener(this);

n3=new JButton("3");
panel.add(n3);
n3.addActionListener(this);
minus=new JButton("-");
panel.add(minus);
minus.addActionListener(this);
dot=new JButton(".");
panel.add(dot);
dot.addActionListener(this);
n0=new JButton("0");
panel.add(n0);
n0.addActionListener(this);
equal=new JButton "=";
panel.add(equal);
equal.addActionListener(this);
plus=new JButton "+";
panel.add(plus);
plus.addActionListener(this);
add(panel,BorderLayout.CENTER);
}
public void actionPerformed(ActionEvent ae)
```

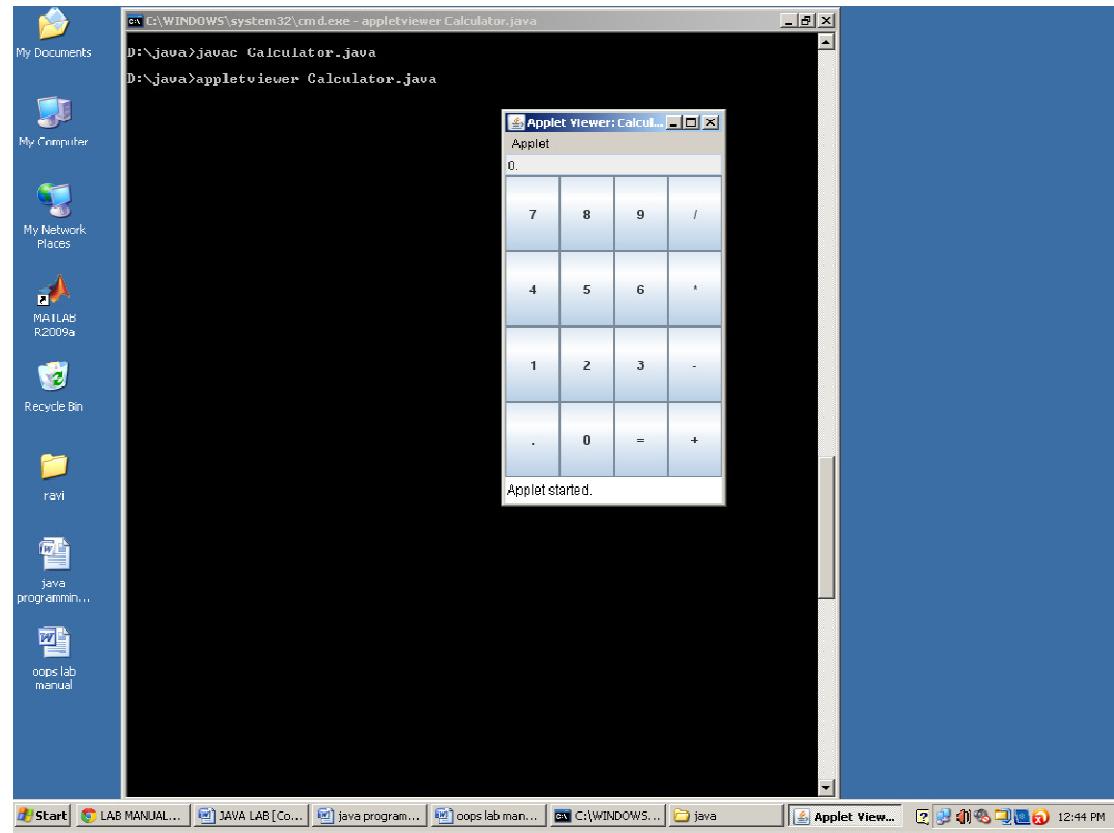

```

{
if(ae.getSource() == n1) assign("1");
else if(ae.getSource() == n2) assign("2");
else if(ae.getSource() == n3) assign("3");
else if(ae.getSource() == n4) assign("4");
else if(ae.getSource() == n5) assign("5");
else if(ae.getSource() == n6) assign("6");
else if(ae.getSource() == n7) assign("7");
else if(ae.getSource() == n8) assign("8");
else if(ae.getSource() == n9) assign("9");
else if(ae.getSource() == n0) assign("0");
else if(ae.getSource() == dot)
{
if(((result.getText()).indexOf(".")) == -1)
    result.setText(result.getText() + ".");
}
else if(ae.getSource() == minus)
{
preRes = Double.parseDouble(result.getText());
lastCommand = "-";
result.setText("0");
}
else if(ae.getSource() == div)
{
preRes = Double.parseDouble(result.getText());
lastCommand = "/";
result.setText("0");
}
else if(ae.getSource() == equal)
{
secVal = Double.parseDouble(result.getText());
if(lastCommand.equals("/"))
    res = preRes / secVal;
else if(lastCommand.equals("*"))
    res = preRes * secVal;
else if(lastCommand.equals("-"))
    res = preRes - secVal;
else if(lastCommand.equals("+"))
    res = preRes + secVal;
result.setText(" " + res);
lastCommand = "=";
}
else if(ae.getSource() == mul)
{
preRes = Double.parseDouble(result.getText());
lastCommand = "*";
result.setText("0");
}
else if(ae.getSource() == plus)
{
preRes = Double.parseDouble(result.getText());
lastCommand = "+";
}
}

```

```
        result.setText("0");
    }
}
}
```

Output:-

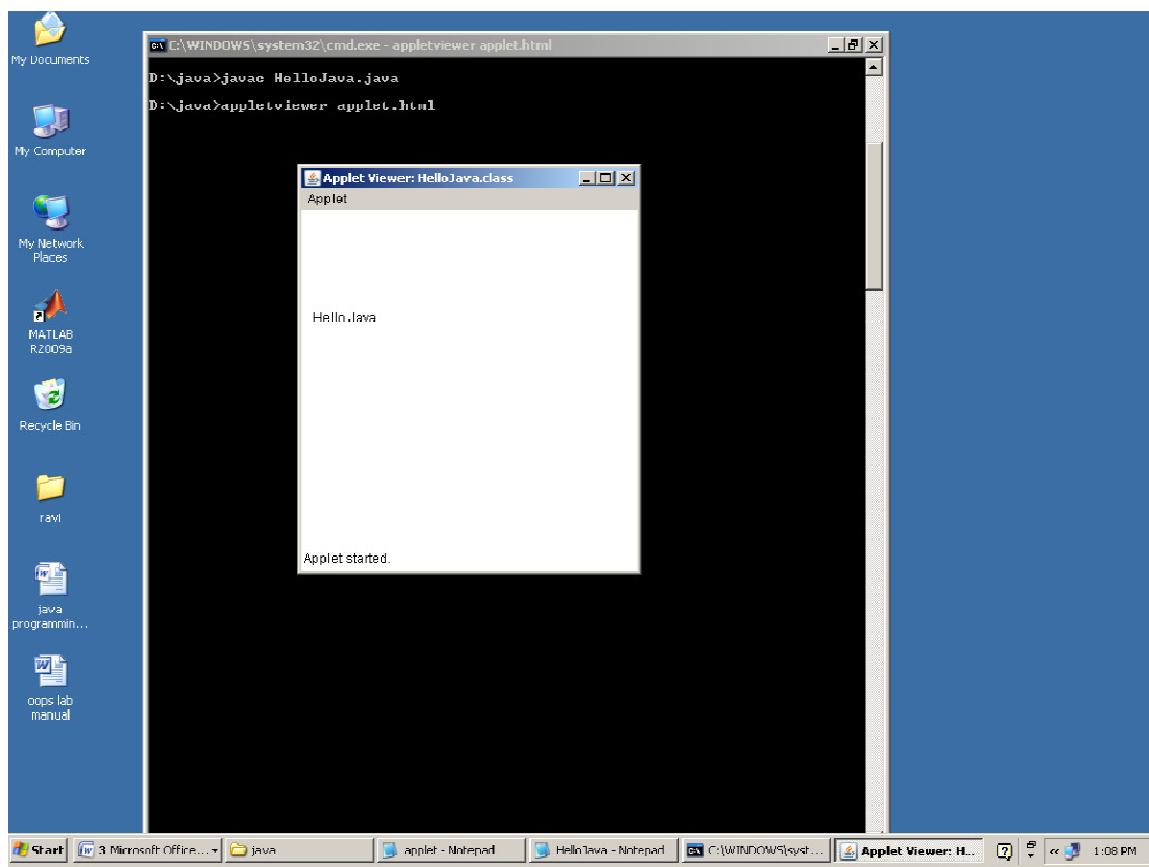

3. a) Develop an applet that displays a simple message.

Program:-

```
import java.awt.*;
import java.applet.*;
/*<applet code = "HelloJava"      width = 200    height = 60 ></applet>*/

public class HelloJava extends Applet {
    public void paint(Graphics g) {
        g.drawString("Hello Java", 10, 100);
    }
}
```

Output:-

3.b) Develop an Applet that receives an integer in one text field & compute its factorial value & returns it in another text filed when the button “Compute” is clicked.

Program:-

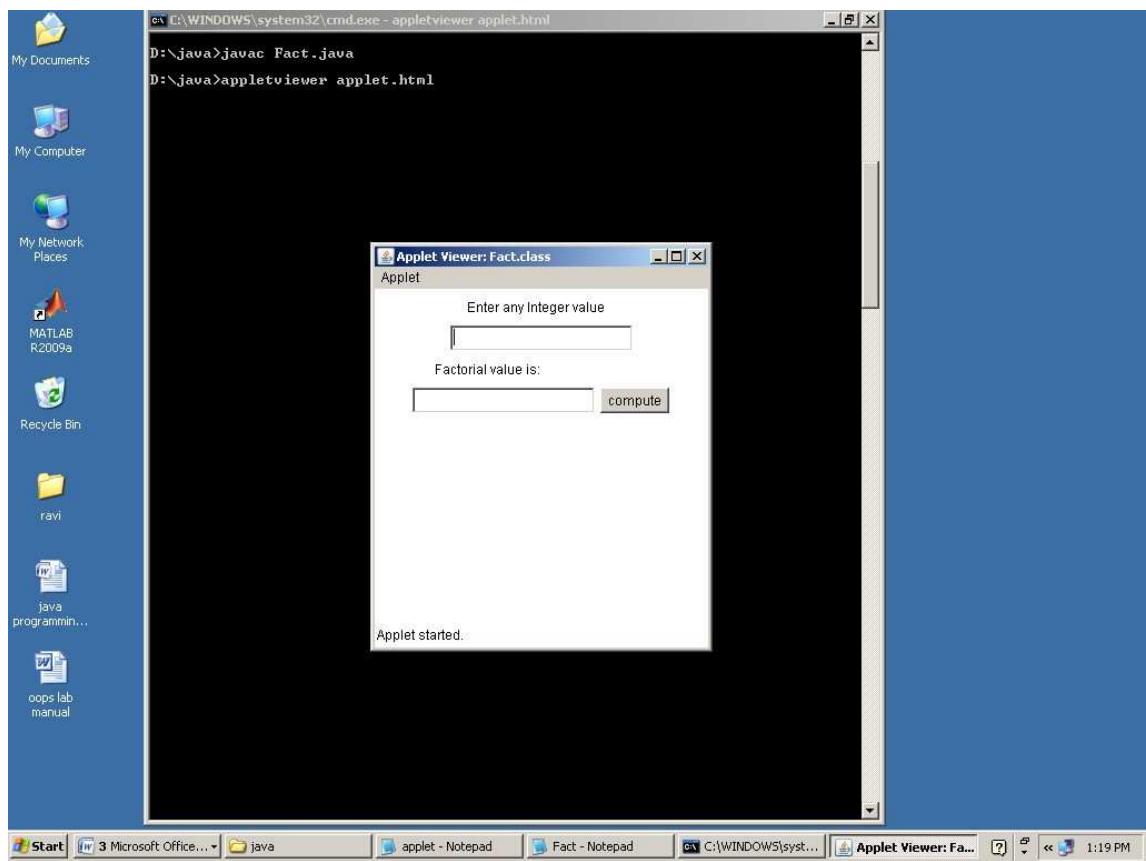

```
import java.awt.*;
import java.lang.String;
import java.awt.event.*;
import java.applet.Applet;
public class Fact extends Applet implements ActionListener
{
    String str;
    Button b0;
    TextField t1,t2;
    Label l1;
    public void init()
    {
        Panel p=new Panel();
        p.setLayout(new GridLayout());
        add(new Label("Enter any Integer value"));
        add(t1=new TextField(20));
        add(new Label("Factorial value is:      "));
        add(t2=new TextField(20));
        add(b0=new Button("compute"));
        b0.addActionListener(this);
    }
    public void actionPerformed(ActionEvent e)
    {
        int i,n,f=1;
        n=Integer.parseInt(t1.getText());
```

```

        for(i=1;i<=n;i++)
        {
            f=f*i;
            t2.setText(String.valueOf(f));
            repaint();
        }
    }

```

Output:-

- 4. Write a program that creates a user interface to perform integer divisions. The user enters two numbers in the text fields, Num1 and Num2. The division of Num1 and Num2 is displayed in the Result field when the Divide button is clicked. If Num1 or Num2 were not an integer, the program would throw a NumberFormatException. If Num2 were Zero, the program would throw an ArithmeticException. Display the exception in a message dialog box.**

Program:-

```
import java.awt.*;
import java.awt.event.*;
import java.applet.*;
public class Add1 extends Applet implements ActionListener
{
    String msg;
    TextField num1, num2, res;
    Label l1, l2, l3;
    Button div;
    public void init()
    {
        l1 = new Label("Number 1");
        l2 = new Label("Number 2");
        l3 = new Label("result");
        num1 = new TextField(10);
        num2 = new TextField(10);
        res = new TextField(30);
        div = new Button("DIV");
        div.addActionListener(this);
        add(l1);
        add(num1);
        add(l2);
        add(num2);
        add(l3);
        add(res);
        add(div);
    }
    public void actionPerformed(ActionEvent ae)
    {
        String arg = ae.getActionCommand();
        if (arg.equals("DIV"))
        {
            String s1 = num1.getText();
            String s2 = num2.getText();
            int num1 = Integer.parseInt(s1);
```

```

int num2 = Integer.parseInt(s2);
if (num2 == 0)
{
msg = "Arithematic Exception ";
repaint();
}
else if ((num1 < 0) || (num2 < 0))
{
msg = "NumberFormatException";
repaint();
}
else
{
int num3 = num1 / num2;
msg = String.valueOf(num3);
}
res.setText(msg);
}
}

public void paint(Graphics g)
{
//g.drawString(msg, 30, 70);
}
}

```

APPLET.HTML

```

<html>

<head>

</head>

<body>

/*<applet code="Add1.class"width=350 height=300>

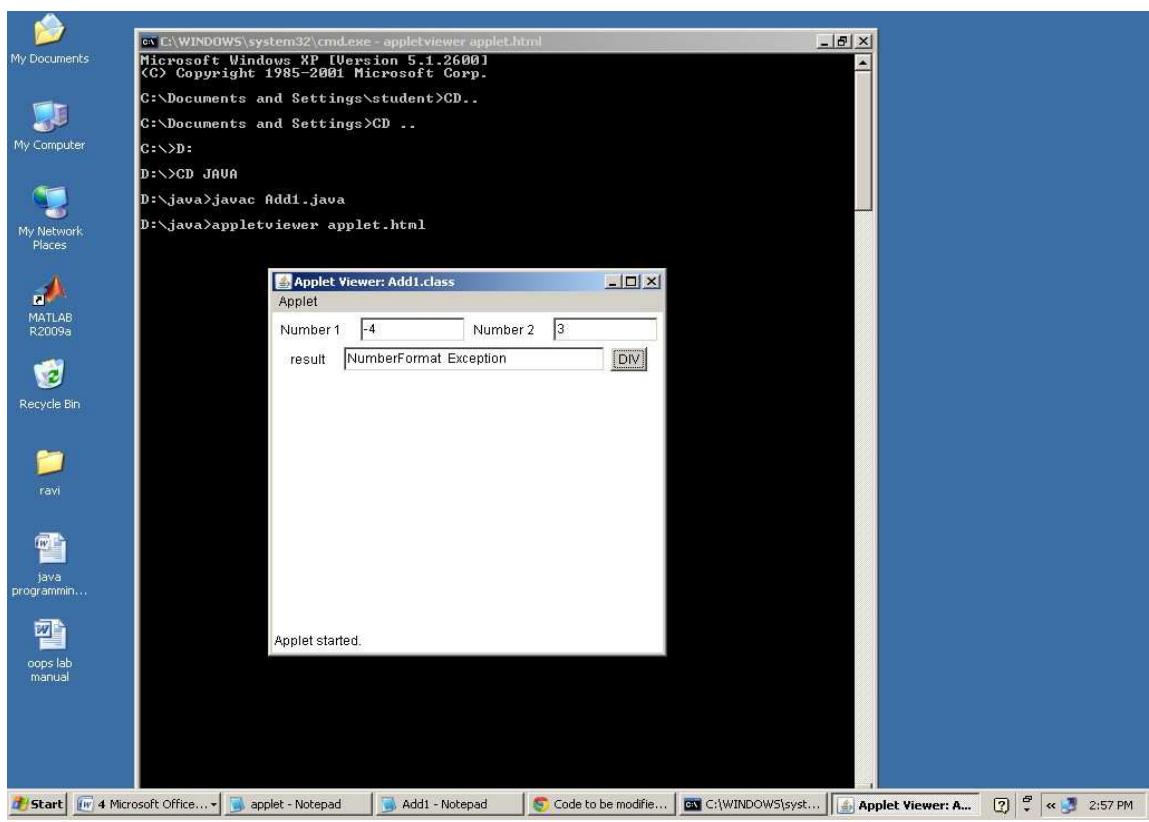

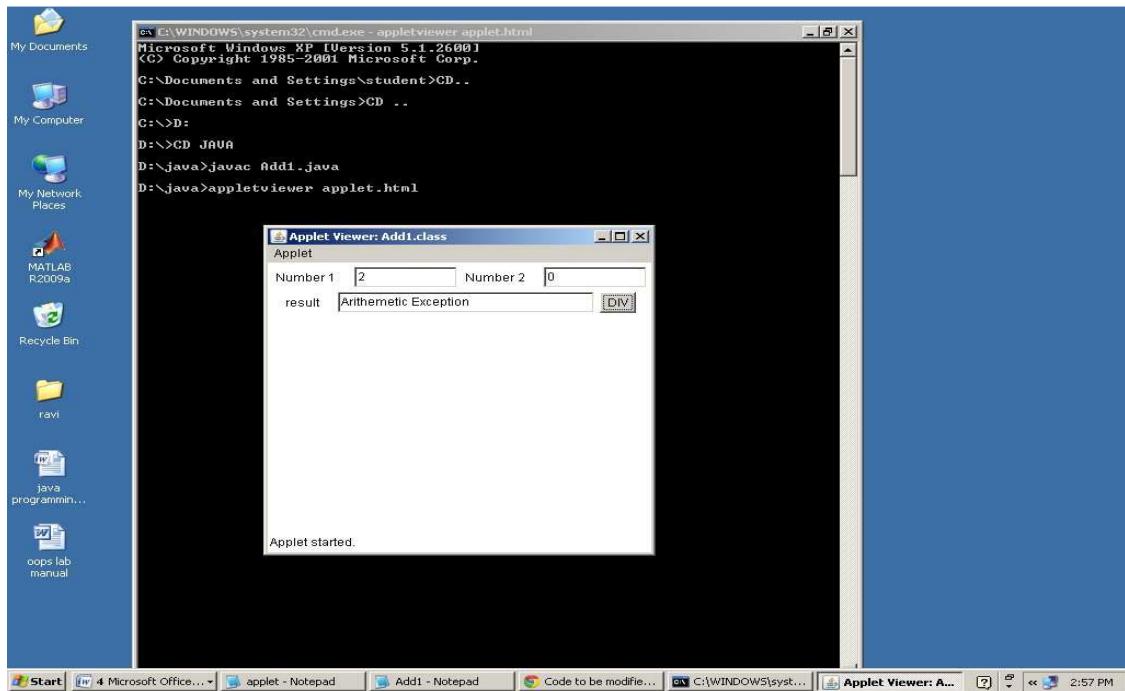

</applet>*/

</body>

</html>

```

Output:-

5.) Write a java program that implements a multi-thread application that has three threads. First thread generates random integer every 1 second and if the value is even, second thread computes the square of the number and prints. If the value is odd, the third thread will print the value of cube of the number.

Program:-

```
class RandomGenThread implements Runnable
{
    double num;
    public void run()
    {
        try {
            SquareThread sqt = new SquareThread();
            Thread squareThread = new Thread(sqt);
            CubeThread cbt = new CubeThread();
            Threadcube Thread = new Thread(cbt);
            squareThread.start();
            cubeThread.start();
            for(int i=0;i<10;i++)
            {
                System.out.println("t1-"+i);
                if(i%2 == 0)
                {
                    sqt.setNum(new Double(i));
                }
                else
                {
                    cbt.setNum(new Double(i));
                }
                Thread.sleep(1000);
            }
        } catch (InterruptedException e)
        {
            e.printStackTrace();
        }
    }
}

class SquareThread implements Runnable
{

    {
        Thread randomThread = new Thread(new RandomGenThread());
        randomThread.start();
    }
}

```

Output:-

6).Write a java program that connects to a database using JDBC and does add, deletes, modify and retrieve operations?

Program:-

ConnectionUtil.java

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;
public class ConnectionUtil
{
    public static Connection getConnection() throws SQLException
    {
        Connection connection = null;
        try
        {
            Class.forName("com.mysql.jdbc.Connection");
            connection = DriverManager.getConnection("jdbc:mysql://192.168.216.250:3306/vijju","root",
            "root");
        }
        catch (ClassNotFoundException e)
        {
            e.printStackTrace();
        }
        catch (SQLException e)
        {
            e.printStackTrace();
        }
        System.out.println("message for connection open"+connection);
        return connection;
    }
}
```

```
}
```

```
}
```

StudentDetails.java

```
public class StudentDetails

{
    private long st_id;
    private String st_name;
    private long st_mobile;
    public StudentDetails(long st_id, String st_name, long st_mobile)
    {
        this.st_id = st_id;
        this.st_name = st_name;
        this.st_mobile = st_mobile;
    }
    public long getSt_id()
    {
        return st_id;
    }

/*<applet code="TrafficSignal.class" height=500 width=300></applet>*/  
</body>  
</html>
```

Output:-

8) Write a java program to create an abstract class named Shape that contains two integers and an empty method named printArea(). Provide three classes named Rectangle, Triangle and Circle such that each one of the classes extends the class Shape. Each one of the classes contain only the method printArea() that prints the area of the given shape.

Program:-

```
abstract class Shape

{

    abstract void numberOfSides();

}

class Trapezoid extends Shape

{

    void numberOfSides()

    {

        System.out.println(" Trapezoidal has four sides");

    }

}

class Triangle extends Shape

{

    void numberOfSides()

    {

        System.out.println("Triangle has three sides");

    }

}

class Hexagon extends Shape

{

    void numberOfSides()

    {

        System.out.println("Hexagon has six sides");

    }

}

class ShapeDemo
```

```
{
public static void main(String args[ ])
{
Trapezoid t=new Trapezoid();
Triangle r=new Triangle();
Hexagon h=new Hexagon();
Shape s;
s=t;
s.numberOfSides();
s=r;
s.numberOfSides();
s=h;
s.numberOfSides();
}
}
```

Output:-

9) Suppose that a table named Table.txt is stored in a text file. The first line in the file header and the remaining lines correspond to row in the table. The elements are separated by commas. Write a Java program to display the table using labels in grid layout.

Program:-

```
import java.awt.*;
import java.awt.event.*;
import javax.swing.*;
import java.util.*;
import java.io.*;

public class Table1 extends JFrame
{
    int i=0;
    int j=0,k=0;
    Object data[][]=new Object[5][4];
    Object list[][]=new Object[5][4];
    JButton save;
    JTable table1;
    FileInputStream fis;
    DataInputStream dis;
    public Table1()
    {
        String d= " ";
        Container con=getContentPane();
        con.setLayout(new BorderLayout());
        final String[] colHeads={"Name","Roll Number","Department","Percentage"};
        try
        {
            String s=JOptionPane.showInputDialog("Enter the File name present in the current directory");
            FileInputStream fis=new FileInputStream(s);
            DataInputStream dis = new DataInputStream(fis);
```

```

while ((d=dis.readLine())!=null)

23
_____
D:\java>javac Table1.java
Note: Table1.java uses or overrides a deprecated API.
Note: Recompile with -Xlint:deprecation for details.
D:\java>java Table1
```

Input

Enter the File name present in the current directory
abc.txt

OK Cancel

The screenshot shows a Windows desktop environment. In the foreground, a command prompt window is open with the path 'cmd C:\WINDOWS\system32\cmd.exe - java Table1'. It displays the output of running the 'Table1' Java program, which prints the values 'a', '123', 'der', and '23' separated by spaces. Below this, it shows the compilation of 'Table1.java' and the execution of the program again. An 'Input' dialog box is overlaid on the command prompt window, prompting the user to enter the file name present in the current directory. The input 'abc.txt' is entered in the text field. At the bottom of the screen, the taskbar is visible with icons for Microsoft Office, Notepad, and various system applications.

```
cmd C:\WINDOWS\system32\cmd.exe - java Table1

Display Data

Name	Roll Number	Department	Percentage
a	123	der	23

The screenshot shows a Windows desktop environment. In the foreground, a command prompt window is open with the path 'cmd C:\WINDOWS\system32\cmd.exe - java Table1'. It displays the output of running the 'Table1' Java program, which prints the values 'a', '123', 'der', and '23' separated by spaces. Below this, it shows the compilation of 'Table1.java' and the execution of the program again, this time resulting in a 'FileNotFoundException' because the file 'abc.txt' was not found. An 'Input' dialog box is overlaid on the command prompt window, prompting the user to enter the file name present in the current directory. The input 'abc.txt' is entered in the text field. At the bottom of the screen, the taskbar is visible with icons for Microsoft Office, Notepad, and various system applications. A 'Display Data' window is also visible, showing a table with four columns: Name, Roll Number, Department, and Percentage. The first row contains the values 'a', '123', 'der', and '23' respectively.

10. Write a Java program that handles all mouse events and shows the event name at the center of the window when a mouse event is fired. (Use adapter classes).

Program:-

```
import java.awt.*;
import java.applet.*;
import java.awt.event.*;
/*<applet code="MouseDemo" width=300 height=300>
</applet>*/
public class MouseDemo extends Applet implements MouseListener,MouseMotionListener
{
    int mx=0;
    int my=0;
    String msg="";
    public void init()
    {
        addMouseListener(this);
        addMouseMotionListener(this);
    }
    public void mouseClicked(MouseEvent me)
    {
        mx=20;
        my=40;
        msg="Mouse Clicked";
        repaint();
    }
    public void mousePressed(MouseEvent me)
    {
        mx=30;
        my=60;
        msg="Mouse Pressed";
    }
}
```

```
repaint();

}

public void mouseReleased(MouseEvent me)

{

mx=30;

my=60;

msg="Mouse Released";

repaint();

}

public void mouseEntered(MouseEvent me)

{

mx=40;

my=80;

msg="Mouse Entered";

repaint();

}

public void mouseExited(MouseEvent me)

{

mx=40;

my=80;

msg="Mouse Exited";

repaint();

}

public void mouseDragged(MouseEvent me)

{

mx=me.getX();

my=me.getY();

showStatus("Currently mouse dragged"+mx+" "+my);
```

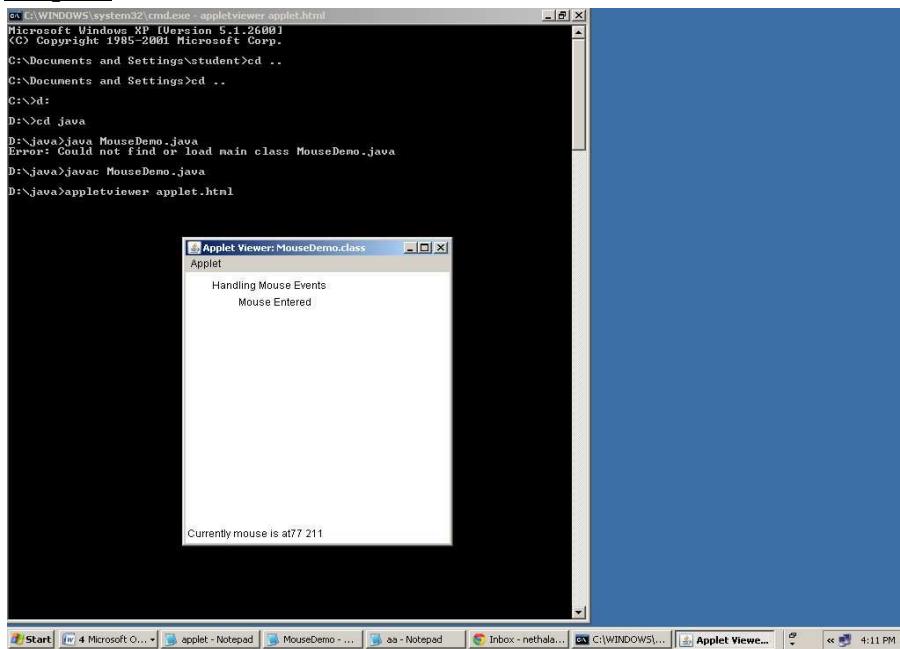

```

repaint(); }

public void mouseMoved(MouseEvent me)
{
mx=me.getX();
my=me.getY();
showStatus("Currently mouse is at"+mx+" "+my);
repaint();
}
public void paint(Graphics g)
{
g.drawString("Handling Mouse Events",30,20);
g.drawString(msg,60,40);
}
}

```

Output:-

- 11).Write a java program that loads names and phone numbers from a text file where the data is organized as one line per record and each field in a record are separated by a tab (\t).it takes a name or phone number as input and prints the corresponding other value from**

the hash table(hint: use hash tables)

Program:-

```

st_id ->DECIMAL  
D:\vijayender\Java Programs>
```

Additional Programs:-

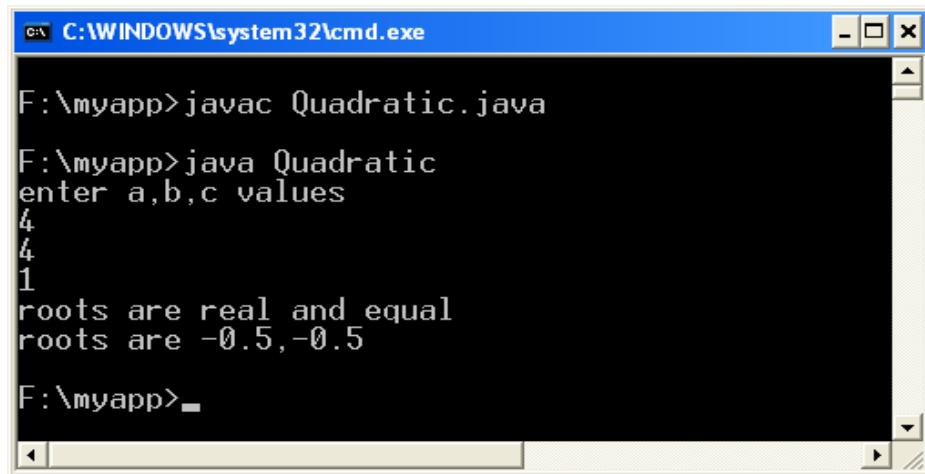

1. Write a Java program that prints all real solutions to the quadratic equation $ax^2+bx+c = 0$. Read in a, b, c and use the quadratic formula. If the discriminant b^2-4ac is negative, display a message stating that there are no real solutions.

Program :-

```
import java.io.*;
class Quadratic
{
    public static void main(String args[])throws IOException
    {
        double x1,x2,disc,a,b,c;
        InputStreamReader obj=new InputStreamReader(System.in);
        BufferedReader br=new BufferedReader(obj);
        System.out.println("enter a,b,c values");
        a=Double.parseDouble(br.readLine());
        b=Double.parseDouble(br.readLine());
        c=Double.parseDouble(br.readLine());
        disc=(b*b)-(4*a*c);
        if(disc==0)
        {
            System.out.println("roots are real and equal ");
            x1=x2=-b/(2*a);
            System.out.println("roots are "+x1+","+x2);
        }
        else if(disc>0)
        {
            System.out.println("roots are real and unequal");
            x1=(-b+Math.sqrt(disc))/(2*a);
            x2=(-b-Math.sqrt(disc))/(2*a);
        }
    }
}
```

```
System.out.println("roots are "+x1+"," +x2);  
}  
else  
{  
    System.out.println("roots are imaginary");  
} } }
```

Input & Output :-

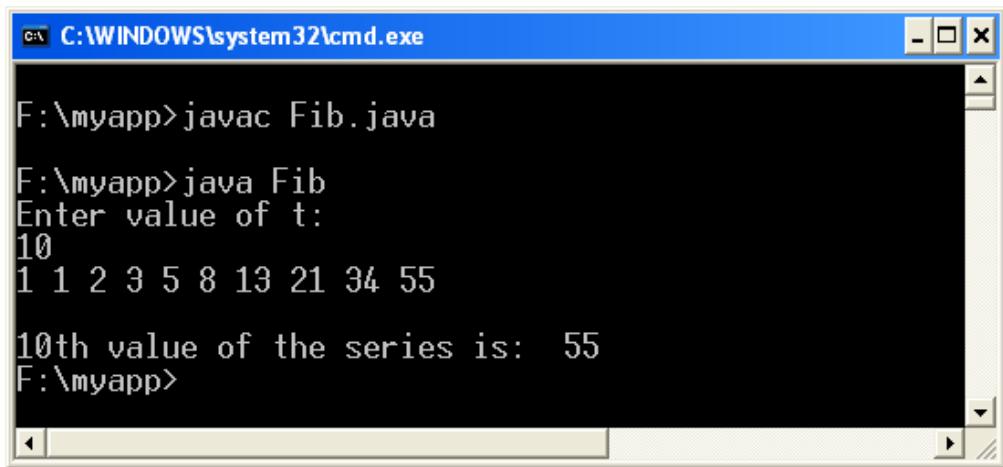

```
C:\WINDOWS\system32\cmd.exe  
F:\myapp>javac Quadratic.java  
F:\myapp>java Quadratic  
enter a,b,c values  
4  
4  
1  
roots are real and equal  
roots are -0.5,-0.5  
F:\myapp>
```

2. The Fibonacci sequence is defined by the following rule. The first 2 values in the sequence are 1, 1. Every subsequent value is the sum of the 2 values preceding it. Write a Java program that uses both recursive and non-recursive functions to print the n^{th} value of the Fibonacci sequence.

Program:-

```
/*Non Recursive Solution*/  
  
import java.util.Scanner;  
  
class Fib {  
  
    public static void main(String args[ ]) {  
  
        Scanner input=new Scanner(System.in);  
  
        int i,a=1,b=1,c=0,t;  
  
        System.out.println("Enter value of t:");  
  
        t=input.nextInt();  
  
        System.out.print(a);  
  
        System.out.print(" "+b);  
  
        for(i=0;i<t-2;i++) {  
  
            c=a+b;  
  
            a=b;  
  
            b=c;  
  
            System.out.print(" "+c);  
  
        }  
  
        System.out.println();  
  
        System.out.print(t+"th value of the series is: "+c);  
  
    }  
  
}
```

Input & Output:-

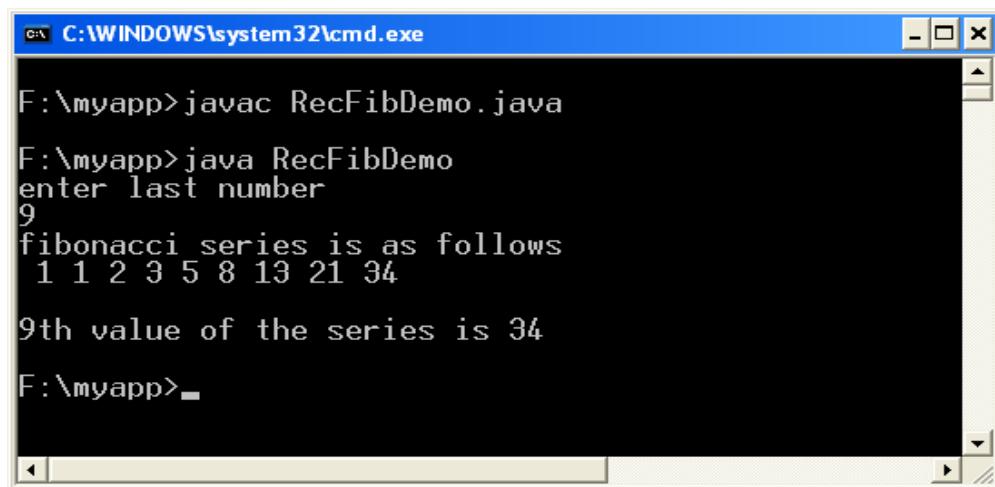

The screenshot shows a Windows Command Prompt window titled 'C:\WINDOWS\system32\cmd.exe'. The command 'javac Fib.java' is run, followed by 'java Fib'. The user is prompted to enter a value for 't', which is 10. The output shows the first 10 numbers of the Fibonacci series: 1 1 2 3 5 8 13 21 34 55. The final message states '10th value of the series is: 55'.

```
/* Recursive Solution*/  
  
import java.io.*;  
  
import java.lang.*;  
  
  
class Demo {  
  
    int fib(int n) {  
  
        if(n==1)  
            return (1);  
  
        else if(n==2)  
            return (1);  
  
        else  
            return (fib(n-1)+fib(n-2));  
    }  
  
}  
  
  
class RecFibDemo {
```

```
public static void main(String args[])throws IOException {  
    InputStreamReader obj=new InputStreamReader(System.in);  
    BufferedReader br=new BufferedReader(obj);  
    System.out.println("enter last number");  
    int n=Integer.parseInt(br.readLine());  
    Demo ob=new Demo();  
    System.out.println("fibonacci series is as follows");  
    int res=0;  
    for(int i=1;i<=n;i++) {  
        res=ob.fib(i);  
        System.out.println(" "+res); }  
    System.out.println();  
    System.out.println(n+"th value of the series is "+res);  
}
```

Input & Output :-

The screenshot shows a Windows Command Prompt window titled 'C:\WINDOWS\system32\cmd.exe'. The command line shows the user navigating to 'F:\myapp' and running 'javac RecFibDemo.java' followed by 'java RecFibDemo'. The application prompts for a 'last number' input of '9'. It then outputs the 'fibonacci series is as follows' followed by the sequence '1 1 2 3 5 8 13 21 34'. Finally, it prints the '9th value of the series is 34'. The window has standard Windows-style scroll bars and a title bar.

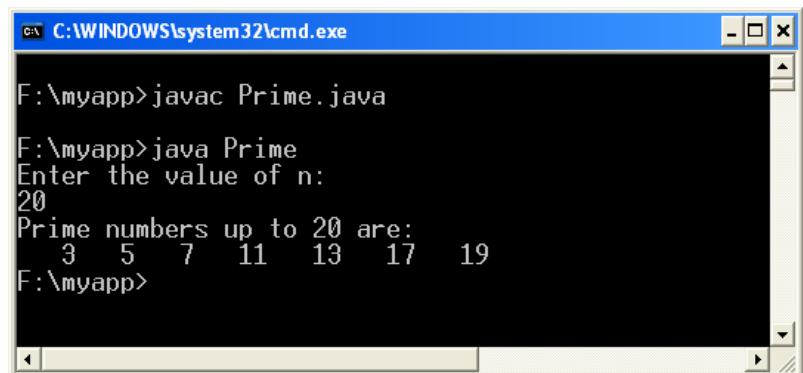

```
F:\myapp>javac RecFibDemo.java  
F:\myapp>java RecFibDemo  
enter last number  
9  
fibonacci series is as follows  
1 1 2 3 5 8 13 21 34  
9th value of the series is 34  
F:\myapp>
```

3.WAJP that prompts the user for an integer and then prints out all the prime numbers up to that Integer.

Program:-

```
import java.util.*  
  
class Test {  
  
    void check(int num) {  
  
        System.out.println ("Prime numbers up to "+num+" are:");  
  
        for (int i=1;i<=num;i++)  
  
            for (int j=2;j<i;j++) {  
  
                if(i%j==0)  
  
                    break;  
  
                else if((i%j!=0)&&(j==i-1))  
  
                    System.out.print(" "+i);  
  
            }  
  
    }  
  
} //end of class Test  
  
class Prime {  
  
    public static void main(String args[ ]) {  
  
        Test obj1=new Test();  
  
        Scanner input=new Scanner(System.in);  
  
        System.out.println("Enter the value of n:");  
  
        int n=input.nextInt();  
  
        obj1.check(n);  
  
    } }
```

Input & Output :-

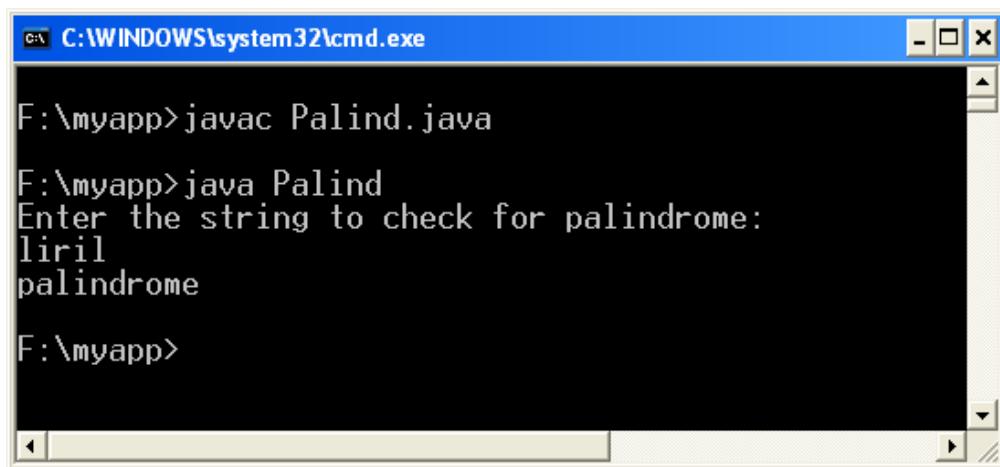

```
C:\WINDOWS\system32\cmd.exe  
F:\myapp>javac Prime.java  
F:\myapp>java Prime  
Enter the value of n:  
20  
Prime numbers up to 20 are:  
3 5 7 11 13 17 19  
F:\myapp>
```

4. WAJP that checks whether a given string is a palindrome or not. Ex: MADAM is a palindrome.

Program:-

```
import java.io.*;
class Palind {
    public static void main(String args[ ])throws IOException {
        BufferedReader br=new BufferedReader(new InputStreamReader(System.in));
        System.out.println("Enter the string to check for palindrome:");
        String s1=br.readLine();
        StringBuffer sb=new StringBuffer();
        sb.append(s1);
        sb.reverse();
        String s2=sb.toString();
        if(s1.equals(s2))
            System.out.println("palindrome");
        else
            System.out.println("not palindrome");
    }
}
```

Input & Output :-

The screenshot shows a Windows Command Prompt window titled 'C:\WINDOWS\system32\cmd.exe'. The command 'javac Palind.java' is entered and executed. The user then runs the program with 'java Palind'. When prompted to enter a string, 'liril' is typed. The program outputs 'palindrome', indicating it is a palindrome. The command prompt then returns to the user's directory 'F:\myapp>'.

```
C:\WINDOWS\system32\cmd.exe
F:\myapp>javac Palind.java
F:\myapp>java Palind
Enter the string to check for palindrome:
liril
palindrome
F:\myapp>
```

5. WAJP for sorting a given list of names in ascending order.

Program:-

```
import java.io.*;  
  
class Test {  
  
    int len,i,j;  
  
    String arr[ ];  
  
    Test(int n) {  
  
        len=n;  
  
        arr=new String[n];  
  
    }  
  
    String[ ] getArray()throws IOException {  
  
        BufferedReader br=new BufferedReader (new InputStreamReader(System.in));  
  
        System.out.println ("Enter the strings U want to sort --- ");  
  
        for (int i=0;i<len;i++)  
  
            arr[i]=br.readLine();  
  
        return arr;  
    }  
  
    String[ ] check()throws ArrayIndexOutOfBoundsException {  
  
        for (i=0;i<len-1;i++) {  
  
            for(int j=i+1;j<len;j++) {  
  
                if ((arr[i].compareTo(arr[j]))>0) {  
  
                    String s1=arr[i];  
  
                    arr[i]=arr[j];  
  
                    arr[j]=s1;  
                }  
            }  
        }  
    }  
}
```

```

        }

    }

}

return arr;

}

void display()throws ArrayIndexOutOfBoundsException {
    System.out.println ("Sorted list is---");
    for (i=0;i<len;i++)
        System.out.println(arr[i]);
}
}

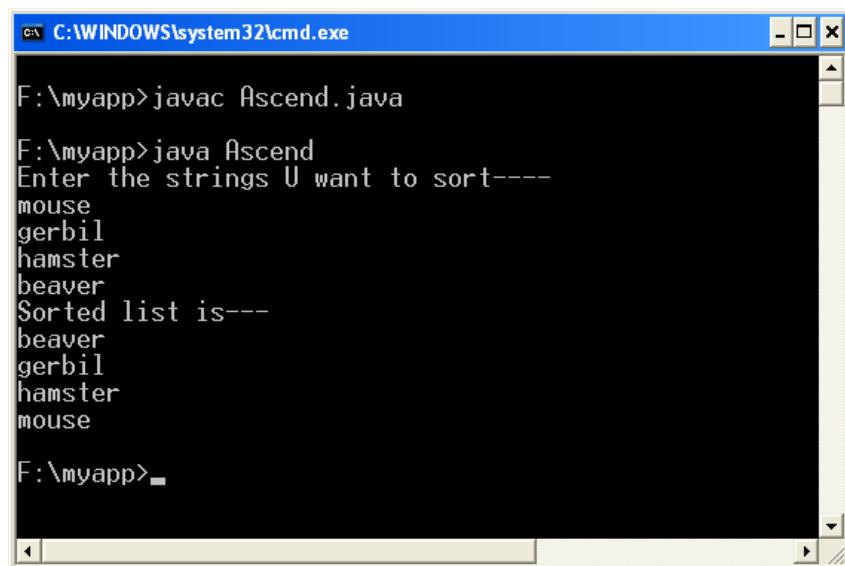

} //end of the Test class

class Ascend {

    public static void main(String args[ ])throws IOException {
        Test obj1=new Test(4);
        obj1.getArray();
        obj1.check();
        obj1.display();
    }
}

```

Input & Output :-

The screenshot shows a Windows command prompt window titled 'C:\WINDOWS\system32\cmd.exe'. The command 'javac Ascend.java' is entered and executed. The user then runs the program with 'java Ascend' and is prompted to 'Enter the strings U want to sort----'. The user inputs four strings: 'mouse', 'gerbil', 'hamster', and 'beaver'. The program then outputs the sorted list: 'beaver', 'gerbil', 'hamster', and 'mouse'.

```

F:\myapp>javac Ascend.java
F:\myapp>java Ascend
Enter the strings U want to sort----
mouse
gerbil
hamster
beaver
Sorted list is---
beaver
gerbil
hamster
mouse
F:\myapp>

```

6. WAJP to multiply two given matrices.

Program :-

```
import java.util.*;  
  
class Test {  
  
    int r1,c1,r2,c2;  
  
    Test(int r1,int c1,int r2,int c2) {  
  
        this.r1=r1;  
  
        this.c1=c1;  
  
        this.r2=r2;  
  
        this.c2=c2;  
  
    }  
  
    int[ ][ ] getArray(int r,int c) {  
  
        int arr[][]=new int[r][c];  
  
        System.out.println("Enter the elements for "+r+"X"+c+" Matrix:");  
  
        Scanner input=new Scanner(System.in);  
  
        for(int i=0;i<r;i++)  
  
            for(int j=0;j<c;j++)  
  
                arr[i][j]=input.nextInt();  
  
        return arr;  
  
    }  
  
    int[ ][ ] findMul(int a[ ][ ],int b[ ][ ]) {  
  
        int c[][]=new int[r1][c2];  
  
        for (int i=0;i<r1;i++)  
  
            for (int j=0;j<c2;j++) {  
  
                c[i][j]=0;  
  
                for (int k=0;k<r2;k++)  
  
                    c[i][j]=c[i][j]+a[i][k]*b[k][j];  
  
            }  
    }  
}
```

```

        return c;
    }

    void putArray(int res[ ][ ]) {
        System.out.println ("The resultant "+r1+"X"+c2+" Matrix is:");
        for (int i=0;i<r1;i++) {
            for (int j=0;j<c2;j++)
                System.out.print(res[i][j]+" ");
            System.out.println();
        } } //end of Test class

    class MatrixMul {

        public static void main(String args[ ])throws IOException {
            Test obj1=new Test(2,3,3,2);
            Test obj2=new Test(2,3,3,2);
            int x[ ][ ],y[ ][ ],z[ ][ ];
            System.out.println("MATRIX-1:");
            x=obj1.getArray(2,3);      //to get the matrix from user
            System.out.println("MATRIX-2:");
            y=obj2.getArray(3,2);
            z=obj1.findMul(x,y);     //to perform the multiplication
            obj1.putArray(z);        // to display the resultant matrix
        }
    }

```

Input & Output :-

```

F:\myapp>javac MatrixMul.java
F:\myapp>java MatrixMul
MATRIX-1:
Enter the elements for 2X3 Matrix:
1 1 1 1 1 1
MATRIX-2:
Enter the elements for 3X2 Matrix:
1 1 1 1 1 1
The resultant 2X2 Matrix is:
3 3
3 3
F:\myapp>

```

7. WAJP that reads

a line of integers and then displays each integer and the sum of all integers. (use StringTokenizer class)

Program :-

```
// Using StringTokenizer class

import java.lang.*;
import java.util.*;

class tokendemo {

    public static void main(String args[ ]) {

        String s="10,20,30,40,50";

        int sum=0;

        StringTokenizer a=new StringTokenizer(s,",",false);

        System.out.println("integers are ");

        while(a.hasMoreTokens()) {

            int b=Integer.parseInt(a.nextToken());

            sum=sum+b;

            System.out.println(" "+b);

        }

        System.out.println("sum of integers is "+sum);

    }

}

// Alternate solution using command line arguments

class Arguments {

    public static void main(String args[ ]) {

        int sum=0;

        int n=args.length;

        System.out.println("length is "+n);

        int arr[] = new int[n];

    }

}
```

```
for(int i=0;i<n;i++)  
arr[i]=Integer.parseInt(args[i]);  
System.out.println("The enterd values are:");  
for(int i=0;i<n;i++)  
System.out.println(arr[i]);  
System.out.println("sum of enterd integers is:");  
for(int i=0;i<n;i++)  
sum=sum+arr[i];  
System.out.println(sum);  
}  
}
```

Input & Output :-

The screenshot shows a Windows Command Prompt window titled 'C:\WINDOWS\system32\cmd.exe'. The command line shows the user navigating to 'F:\myapp' and running 'javac TokenDemo.java'. The application then runs 'TokenDemo' and prints the integers 10, 20, 30, 40, and 50, followed by the message 'sum of integers is 150'. The window has standard Windows-style title bar controls (minimize, maximize, close) and scroll bars.

```
F:\myapp>javac TokenDemo.java  
F:\myapp>java TokenDemo  
integers are  
10  
20  
30  
40  
50  
sum of integers is 150  
F:\myapp>
```

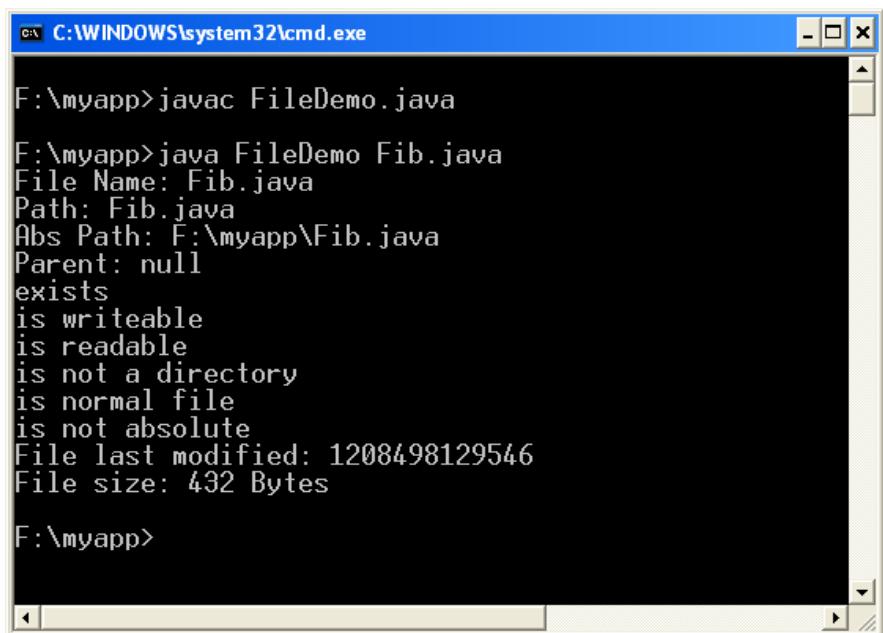

8. WAJP that reads on file name from the user, then displays information about whether the file exists, whether the file is readable, whether the file is writable, the type of file and the length of the file in bytes.

Program :-

```
import java.io.File;
class FileDemo {
    static void p(String s) {
        System.out.println(s);
    }

    public static void main(String args[ ]) {
        File f1 = new File(args[0]);
        p("File Name: " + f1.getName());
        p("Path: " + f1.getPath());
        p("Abs Path: " + f1.getAbsolutePath());
        p("Parent: " + f1.getParent());
        p(f1.exists() ? "exists" : "does not exist");
        p(f1.canWrite() ? "is writeable" : "is not writeable");
        p(f1.canRead() ? "is readable" : "is not readable");
        p("is " + (f1.isDirectory() ? "" : "not" + " a directory"));
        p(f1.isFile() ? "is normal file" : "might be a named pipe");
        p(f1.isAbsolute() ? "is absolute" : "is not absolute");
        p("File last modified: " + f1.lastModified());
        p("File size: " + f1.length() + " Bytes");
    }
}
```

Input & Output :-

The screenshot shows a Windows Command Prompt window titled 'C:\WINDOWS\system32\cmd.exe'. The command F:\>javac FileDemo.java is run, followed by F:\>java FileDemo Fib.java. The output displays the following file information for 'Fib.java':

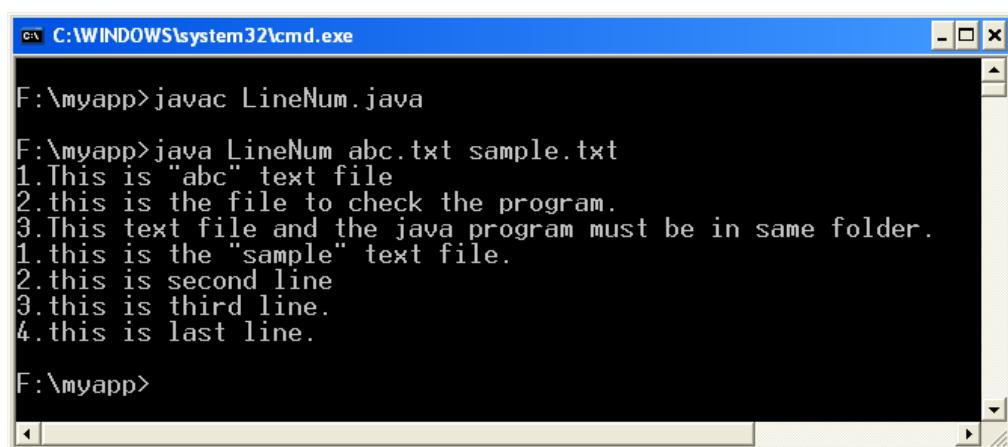

```
F:\>javac FileDemo.java
F:\>java FileDemo Fib.java
File Name: Fib.java
Path: Fib.java
Abs Path: F:\myapp\Fib.java
Parent: null
exists
is writeable
is readable
is not a directory
is normal file
is not absolute
File last modified: 1208498129546
File size: 432 Bytes
```

9. WAJP that reads a file and displays the file on the screen, with a line number before each line.

Program :-

```
import java.io.*;  
  
class LineNum{  
  
    public static void main(String args[]){  
  
        String thisline;  
  
        for(int i=0;i<args.length;i++)  
  
        {  
  
            try{  
  
                LineNumberReader br=new LineNumberReader(new FileReader(args[i]));  
  
                while((thisline=br.readLine())!=null)  
  
                {  
  
                    System.out.println(br.getLineNumber()+"."+thisline);  
  
                }  
  
            }catch(IOException e){  
  
                System.out.println("error:"+e);  
  
            } } } }
```

Input & Output :-

```
C:\WINDOWS\system32\cmd.exe  
F:\myapp>javac LineNum.java  
F:\myapp>java LineNum abc.txt sample.txt  
1.This is "abc" text file  
2.this is the file to check the program.  
3.This text file and the java program must be in same folder.  
1.this is the "sample" text file.  
2.this is second line  
3.this is third line.  
4.this is last line.  
F:\myapp>
```

10. WAJP that displays the number of characters, lines and words in a text file.

Program :-

```
import java.io.*;

public class FileStat {

    public static void main(String args[ ])throws IOException {
        long nl=0,nw=0,nc=0;
        String line;
        BufferedReader br=new BufferedReader(new FileReader(args[0]));
        while ((line=br.readLine())!=null) {
            nl++;
            nc=nc+line.length();
            int i=0;
            boolean pspace=true;
            while (i<line.length()) {
                char c=line.charAt(i++);
                boolean cspace=Character.isWhitespace(c);
                if (pspace&&!cspace)
                    nw++;
                pspace=cspace;
            }
        }
        System.out.println("Number of Characters"+nc);
        System.out.println("Number of Characters"+nw);
        System.out.println("Number of Characters"+nl);
    }

    // Alternate solution using StringTokenizer
    import java.io.*;
```

```
import java.util.*;

public class FileStat {

    public static void main(String args[ ])throws IOException {
        long nl=0,nw=0,nc=0;

        String line;
        BufferedReader br=new BufferedReader(new FileReader(args[0]));

        while ((line=br.readLine())!=null) {
            nl++;
            nc=nc+line.length();

            StringTokenizer st = new StringTokenizer(line);
            nw += st.countTokens();
        }
        System.out.println("Number of Characters"+nc);
        System.out.println("Number of Characters"+nw);

        System.out.println("Number of Characters"+nl);
    }
}
```

Input & Output :-

```
C:\WINDOWS\system32\cmd.exe
F:\myapp>javac FileStat.java
F:\myapp>java FileStat abc.txt
Number of Characters120
Number of Characters25
Number of Characters3
F:\myapp>
```
